Please attach a narrative (not to exceed 4 pages, excluding appendices) addressing the following:

- What are the student learning outcomes? Please provide a numbered list.
  
  1. Graduates of the program are expected to be successful in pursuing careers in the direct practice of physics or further education in more advanced programs in physics or related fields.
  
  2. Graduates of the program are ready to be team contributors or leaders, capable of collaboration and thinking independently.
  
  3. Graduates of the program are trained to be effective communicators (both orally and in the written word) professionally and socially.
  
  4. Graduates of the program are prepared through coursework and cutting-edge research to be professional problem solvers.
  
  5. Graduates are expected to possess the ability to work in the laboratory, understand how to take and analyze experimental data and/or generate...
Which learning outcomes were assessed? All outcomes were assessed (1-5).

How were they assessed? (Programs must use at least one direct assessment of student learning.) Our primary tools of assessment lie in the thesis requirement. The masters candidate presents his/her thesis work in written form (the thesis) and in oral form (the defense). Outcomes 1-5 are assessed during this time. We also conduct an exit interview with all of our students to partially-assess outcome 1 and via subsequent contact with the students after graduation.

Undergraduate programs should assess at least one University Undergraduate Learning Outcome (UULO) each year, which may or may not overlap with a program learning outcome. Not applicable as this is a graduate degree.

Graduate programs should assess at least one outcome related to one of the following graduate level requirements each year:

6. student engagement in research, scholarship, creative expression and/or appropriate high-level professional practice.
7. activities requiring originality, critical analysis and expertise.
8. the development of extensive knowledge in the field under study.

For the doctor of philosophy in physics degree, we assess outcome 6 in particular and, to a lesser extent, outcomes 7 and 8.

Though students are not required to publish peer-reviewed papers for their thesis, we strongly encourage it. With few exceptions that I am aware of, most of our students do publish at least some of their work in peer-reviewed journals. They are also strongly encouraged to present their research at various local, regional, national and international conferences. Graduate students also participated in various summer schools/workshops as well as were awarded research internships at Los Alamos and Lawrence Livermore National Laboratories (LANL and LLNL). These experiences are intended to aid the students in developing their thesis projects, improving their research skills, and exposing them to US Department of Energy facilities and research challenges that are worked on by these facilities.

During the student’s career, they are expected to hold yearly meetings with their thesis committee and discuss progress (both course-related and thesis-related) by giving a presentation discussing their progress. The student’s progress is judged during these meetings by private conversations amongst the committee members.

Finally, our department has also instituted a policy (agreed upon formally by the Department last Fall) to have the Assessment Coordinator interview all graduating undergraduates one-by-one. Questions from a standard template are asked and recorded. The Physics and Astronomy department requires its’ Ph.D.-seeking students to pass a written exam. They are allowed two attempts to pass the exam. If they do not, they are asked to leave the program.

What was learned from the assessment results?

The faculty have made great strides in improving the quality and expectations of the masters thesis. We have found that the requirement of graduate students to meet with their thesis committee at least yearly has been very instrumental in identifying potential problems early and help them develop their thesis project and focus on the research problem sooner. As a result, we have observed a reduced average time for our students to complete and defend their masters thesis on average.
From the exit interview data gathered, students have complained about the lack of offerings of important upper-level courses that they need to graduate. This is in part due to a paucity of professors as a number have either retired or passed away. There was also some criticism of the varying level of teaching and supervisory quality with some professors (allegedly) leaving class early (e.g.). As result, some students didn’t feel that they learned as much as they should have for some classes. Some students explained that they like professors who teach via the blackboard rather than powerpoint. Some courses used math which some of students explained that they had not formally had yet. Various textbooks were criticized as being too outdated.

On the positive side, students in general felt that by having significant research experience and exposure as an undergraduate, they were well prepared for pursuing graduate studies and lifelong learning. All students interviewed felt that their UNLV physics education would help them succeed. In general, the students felt that their UNLV physics undergraduate education was excellent and were all largely satisfied. We also are developing a tremendous track record of having our students continue on to further their studies via graduate school (both here at UNLV and elsewhere) and/or other training.

The High Pressure Science and Engineering Center (HiPSEC) within our physics and astronomy department has also received feedback from the US Department of Energy/NNSA on our efforts to train the next generation of America's weapons scientists and the feedback has in general been very positive. The NNSA reviewers suggested that we expand our efforts to expose students to national facilities and NNSA problems of interest by encouraging them to seek internships and fellowships outside of UNLV.

We have also learned that more often than not, students who graduated in physics from UNLV as undergraduates generally pass the qualifying Ph.D. exam whereas students from other schools often do not. This is an important issue for us as we seek Tier 1 status and are working to accept higher quality students.

How did the program respond to what was learned?

The Assessment coordinator plans to have a meeting with the Chair to discuss results of the exit interviews and discuss them at an upcoming meeting sometime this Spring of 2016. We have also hired a tenure-track experimental condensed matter physicist (Ashkan Salamat) who will aid in shouldering some of the burden for upper level graduate courses. A tenure-track astrophysicist (Jason Steffen) has also been hired and there is a search underway for another astrophysicist. These hires were instituted to replace retired or deceased faculty.

Due to the suggestions made by the NNSA reviewers, we have made more efforts encourage our students to apply for research-based internships (e.g. at Los Alamos or Lawrence Livermore National Labs) as well as summer school workshops. One of Professor Pravica’s students (Melanie White) attended a summer workshop at Los Alamos National Laboratory last summer (e.g.). We feel that the efforts will aid the students in making positive contacts with scientists at these DOE-run facilities which may aid them when later seeking employment.

We strongly encourage applying students to take the GRE Physics exam but for a variety of reasons, we have in the past accepted students into the program who had not taken the GRE. With Prof. Victor Kwong (Graduate physics coordinator), we are working to ameliorate this issue. The topic is also frequently discussed among our faculty.
Please limit the narrative portion of your report to no more than four pages. You may attach appendices with data, tables, charts, or other materials as needed. Please explain the relevant conclusions from any appendices in your narrative. Please contact the Office of Academic Assessment if you have questions or need assistance.
